I have a website and I want to authenticate users via Google. What are the APIs that I need to use? A: Yes, you can use Google OAuth inside an ASP.NET MVC application. You just need to get the client id and client secret from Google and add it to your ASP.NET MVC application. For example, if you want to use a Google Plus login, you can use the code below: var clientId = "xx"; var clientSecret = "xx"; var plusService = new PlusService(new BaseClientService.Initializer() { HttpClientInitializer = new PlusHttpClientInitializer(clientId, clientSecret), ApplicationName = "GooglePlusSample" }); var user = plusService.Users.Get("me").Fetch(new FetchParameters() { View = "me" }); In Google's documentation on how to integrate with Google+, they use the user-agent trick to get the client id and client secret. If you're using Facebook, you should be able to use the same trick. Disclaimer: I am not at all involved in the development of this library. Q: c# Exception handling I am not really good with exception handling in C#. I have the following code and it works fine, except for the fact that I know there is a way to do exception handling easier. public partial class Form1 : Form { private double data1; public Form1() {
