Don't know how to login or reset your password? If you forgot

your password, try to reset it here. Get a free email account with Google Gmail. The best email service provider. It's easy to make a hair style for you own photo. Using HairStyle_CS3.5 you can cut, move and rotate a vector hair. Easy to use. You can do hair styling in Photoshop. Give us a hand to create hairstyle for you.

Q: Python datetime.strptime error as a list I am working on a project, where I use python to read in a CSV file

with 1000+ lines. The beginning of each line is a datetime string in the format of '2012-07-10T01:01:01.3', which is the last number in the string being the milliseconds. In the code I am using, I convert each line to a list, then use a for loop to print the value of the year, month, day, hour, minute, and second. The values from the CSV file are printing out correctly, however the format of the datetime string is throwing

off the code I am trying to run on it, and it throws an error.

When it runs the code, it states the following error. ValueError:

time data

'2012-07-10T01:01:01.3' does not match format

'%Y-%m-%dT%H:%M:%S.%f'

Can someone point me in the right direction here? My code is

as follows. year = [] month = []

day = [] hour = [] minute = []

second = [] for line in csvfile:

(line) = list(csv.reader(line)) for

```
row in (line): if row[0] == '1':  
    year.append(int(row[1]))  
    month.append(int(row[2]))  
2d92ce491b
```
