Methadone. This article discusses the administration of methadone for the treatment of opioid addiction and pain. Methadone is a synthetic opioid with actions similar to those of morphine, but with a different pharmacokinetic profile. Methadone has been used for the treatment of opiate addiction for decades, but has taken on an expanded role as a medication for the treatment of pain.

Methadone has a good safety profile, but does have the serious potential for serious respiratory depression when used for chronic dosing. In addition, patients on long-term methadone often have an incomplete understanding of its adverse effects, which can lead to them falling into a cycle of addiction and chronic pain, with few effective options for pain management.

Multidisciplinary care in an institution can provide a safe and effective management strategy for a complex patient population. For the love of getting it right. The thing I've found most frustrating about software development is working with other developers. It's hard to explain how frustrating it can be without some examples. Say you want to do two things: -
